The complexity crisis facing IT teams

Traditional access tools weren't built for the explosion of identities created by SaaS and IaaS adoption. Most IT teams are still struggling to get oversight of who or what has access to critical data, managing access with slow, error-prone workflows scattered across multiple systems. And now AI is compounding the crisis.

Gartner projects the average Fortune 500 will manage 150,000 AI agents by 2028.¹ Without the tools to support AI adoption while maintaining control, IT faces the impossible choice of blocking productivity or increasing business risk. IT teams need access governance designed for the AI era, so they can take back control and lead the AI transformation with confidence.

Simplify IT and drive operational efficiency

Reduce IT costs

Automated provisioning, reviews, and lifecycle workflows reduce helpdesk tickets and lower the total cost of access operations.

Accelerate time to productivity

Policy-driven automation replaces manual onboarding and approvals, giving employees the access they need from day one without delays.

Streamline audit and compliance

Automatically generate audit-ready evidence for every access event, ensuring policies are consistently enforced and audit processes are smooth.

A single control plane to govern every identity at enterprise scale

C1 is the identity platform built for the agentic enterprise. One platform governs every human, workload, and AI agent across the environment.

The result is identity that operates as infrastructure rather than overhead. Work that used to take weeks (access reviews, role changes, agent provisioning) runs in minutes. Agent tool calls come online under the same governance humans live under. IT stops slowing the business while the business stops outrunning IT with ticket overload.

Why C1 for IT leaders

End-to-end lifecycle automation

Streamline onboarding, moving, and offboarding to keep the business productive while freeing up IT resources to focus on innovation, not administration.

Access on demand, no tickets needed

Users and AI agents self-service request from Slack, MS Teams, MCP, CLI, or web app. Policy-based auto-approves or routes to the right approver with full context, and provisioning happens in seconds.

Access reviews done in days, not months

Intelligent access reviews run autonomously and route review tasks to the right owners. AI recommendations accelerate reviewer completion time while eliminating rubber-stamping.

Fast, governed AI adoption

Give employees an easy, approved path to the AI tools they need, with policy-based controls and full audit trails. Shadow AI adoption drops when the governed path is frictionless, and compliance teams get the visibility they require.

No more visibility gaps

See every identity — humans, service accounts, and AI agents — in one place. Automatically surface and remediate orphaned accounts, dormant access, and over-permissioned entitlements.

Measurable impact with C1

Automated provisioning, reviews, and lifecycle workflows reduce helpdesk tickets and lower the total cost of access operations. Policy-driven automation replaces manual approvals, giving employees the access they need from day one without delays. And C1 governs access across cloud and on-prem environments, distributed workforces, and a growing AI agent ecosystem, without requiring IT to rebuild its operational model.
