The high cost of slow access.

AI is only as valuable as the access and context it can act on. Most organizations can't deliver the right access to every identity, across every system, at the speed the business needs. Security, IT, and identity teams face this challenge daily, constantly adding in new integrations to account for every new agent or workflow. Context fragments, access reviews take weeks, and standing privileges pile up. The risk is real: 82% of firms reported at least one identity-related breach in the last year.¹ As AI adoption accelerates, the problem compounds. Without a governed path that moves at enterprise speed, teams work around governance entirely.

One platform for every identity, human and AI.

C1 is the identity platform built for the agentic enterprise. One platform governs every human, workload, and AI agent across the environment.

The result is identity that operates as infrastructure rather than overhead. Work that used to take a week (access reviews, role changes, just-in-time grants, agent provisioning) runs in minutes. Agent tool calls come online under the same governance humans live under. Security stops slowing the business while the business stops outrunning security.

Identity is the control plane for the agentic enterprise.

Govern with confidence

Every identity, human and AI, on one platform.

Secure AI adoption

AI tools, agents, and MCP calls under the same governance as humans.

Built-in speed

Identity runs as infrastructure, callable from any tool.

AI-native capabilities

- ✓ **Describe what you want; the platform builds it.** AI creates policies and workflows from plain-language descriptions, and surfaces the context behind every decision.
- ✓ **Teams get the tools they need without filing a ticket.** Self-service access auto-approves in seconds. Across any MCP server, any auth model.

Unified identity graph

- ✓ **See every identity in one place.** Employees, contractors, service accounts, and AI agents. Eliminate blindspots, surface risks, and right-size access.
- ✓ **Get answers to your identity and access questions.** Search for orphaned accounts, high-risk access, and entitlement sprawl across your entire environment.

Policy engine

- ✓ **Cut standing privilege by 95%.** Grants exist only as long as work needs them, and access stops the moment role, risk, or context shifts.
- ✓ **Prove every decision at audit, automatically.** Every action lands in one trail with the policy reasoning attached.

One platform for AI transformation, governed in real-time.

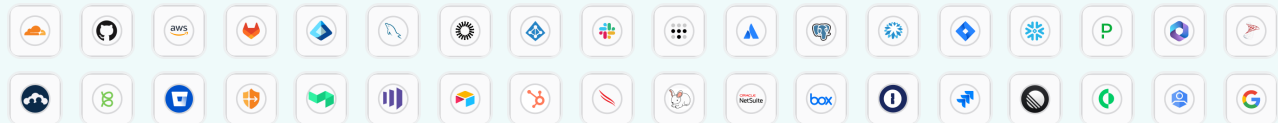

Every system. Already covered.

Built on Baton, our open-source connector framework, C1 covers nearly every system in the modern stack. Need a custom integration? AI builds the connector in minutes. C1 hosts the connectors for you, or runs them inside your own infrastructure for full data sovereignty.

Every agent, governed from day one.

AI agents act on systems through MCP. Some vendors ship their own MCP servers; most haven't yet. C1 ships its own so every agent tool call gets governed from day one, routed through the same policy engine and audit trail as every human request.

300+ Connectors | **3,000+ MCPs** SaaS, AI tools & MCP, Cloud, On-Prem, Data Sources

Start confidently. Scale fearlessly.

The companies leading in AI transformation aren't the ones with the most agents. They're the ones who can govern every agent, tool, and human on the systems that matter, the moment the business needs them. That takes identity infrastructure that's cross-cutting, real-time, and policy-driven by default.

C1 is infrastructure. Ship AI at speed, without shipping risk.
