

AI-Native Identity Governance

Identity governance for the AI era. Govern every human, workload, and agent with automation, intelligence, and speed.

The human workforce problem never went away. Agents made it bigger.

Legacy identity governance was built for human employees, a handful of core apps, and a certification campaign once a quarter. Cloud sprawl and service accounts multiplied the identities under governance, while the tools to govern them still assume a person is clicking through a console. Only 24% of organizations report fully integrated or automated identity workflows.¹ The rest stitch reviews, approvals, and lifecycle together by hand.

The cost shows up wherever governance touches. Reviews drag on for weeks and get rubber-stamped. Joiner-mover-leaver changes wait on tickets. Standing privilege piles up because revoking it is manual. Now the same program has to govern AI agents that spin up in seconds, most with no identity of their own. Bolting an AI module onto a stack built for human clicks doesn't close the gap.

What C1.ai delivers

Every identity, one platform

Humans and agents under one set of policies, reviews, and lifecycle, with NHI discovery, ownership tracking, and findings.

Less busywork, more oversight

AI drafts policies, accelerates reviews, and automates routine lifecycle work, so your team can focus on the decisions that need a person.

Govern where teams work

Access requested and granted from Slack, Teams, CLI, or the console.

Identity governance, rebuilt for the AI era.

C1 Identity Governance runs every part of identity governance on one platform: visibility, access reviews, lifecycle, least privilege, separation of duties, and auditing. It treats humans, workloads, and agents as one problem, not three. C1.ai's review assistant works through review tasks from plain-language instructions, staging every change for a human to preview before it's submitted.

Access is requested from Slack, Teams, the CLI, a coding agent, or the web app, and C1 MCP lets AI assistants query identity data. A request filed in Slack is evaluated against the same policy and written to the same audit trail as one made in the console. The result is a program that gets lighter as the environment grows.

Modern IGA for every identity.

See and govern every identity in one place.

Map fine-grained access for humans, service accounts, and agents across cloud, SaaS, and legacy or homegrown systems. Ask where access is orphaned or over-privileged and get an answer, not a spreadsheet.

Lifecycle automation for every identity.

Joiner-mover-leaver runs as automated workflows for employees, contractors, and agents alike: access on day one, revoked the moment it's no longer needed, no tickets.

Run governance from a prompt.

Ask C1AI in the web app or Slack, or connect your own AI assistant through C1 MCP, to answer access questions and make changes in plain language. Manage configuration as code with the C1.ai Terraform provider.

Access that adapts to context.

Policies grant, adjust, and revoke based on role, attributes, and risk signals, so least privilege holds as context changes, without manual rework.

Reviews in minutes, not weeks.

AI takes the first pass on every review, flagging risky grants and separation-of-duties conflicts for a human. Scope campaigns by risk level or compliance framework, with audit-ready evidence on demand.

Connect your whole stack.

300+ prebuilt C1 Connectors cover cloud, SaaS, on-prem, and homegrown systems. Build what's missing with Baton, our open-source connector SDK.

Governance that gets lighter as the environment grows.

Staying in control of identity doesn't come from piling on more tools or running more review campaigns. It comes from governing every identity on one platform, automating the work that used to take a team, and letting people and agents get access wherever they work. Legacy IGA can't get there by adding an AI feature; it was built for human clicks and quarterly campaigns. C1 Identity Governance is modern identity governance built for the AI era, live in weeks instead of a year.

"C1 was up and running in under an hour, integrating into our Okta directory and GitHub orgs and allowing us to start configuring immediately."

Matthew Sullivan Infrastructure Security Team Leader, Instacart

About C1.ai

C1.ai is the identity platform for the AI era. Our platform connects humans and agents to enterprise systems with scoped access, enforced policies, human approval, and a record of every action. With C1.ai, the fastest path to AI adoption at scale is the governed path — giving organizations visibility and control without sacrificing security or slowing innovation. Companies such as Ramp, Zscaler, Qualtrics, and DoorDash trust C1.ai to govern identity, secure agents, and empower their teams to put AI to work.

Put AI to work.
